      Winters P., Wipat A., Yamamoto H., Yamane K., Yasumoto K., Yata K., Yoshida K., Yoshikawa H.F., Zumstein E., Yoshikawa H., Danchin A.; "The complete genome sequence of the Gram-positive bacterium Bacillus subcilis.";
                                                              FUNCTION: SPOYS PROTEIN IS INVOLVED, DIRECTLY OR INDIRECTLY, IN SPORE CORTEX BIOSYNTHESIS AND AFFECTS ONLY INDIRECTLY EXPRESSION OF LATE SPORULATION GENES.

SUBCELLULAR LOCATION: Integral membrane protein (Probable).

BUBCILOPMENTAL STAGE: SPONY TRANSCRIPTION TAKES PLACE DURING THE SECOND HOUR OF SPORULATION. IT MAY BE TRANSCRIBED MAINLY, IF NOT ONLY, IN THE MOTHER CELL. INDEED, IT IS REQUIRED ONLY IN THE MOTHER CELL.
                                                                                                                                                                         SIMILARITY: Belongs to the polysaccharide synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7.6%; Score 134; DB 1; Length 518;

USUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: Not tissue specific.
PTM: Phosphorylated (Possible).
SIMILARITY: Belongs to the Na(+)/H(+) exchanger family.
CAUTION: The number, localization and denomination of hydrophobic domains in the Na(+)/H(+) exchangers vary among authors.
CAUTION: Hydrophobic domains A, B and L are not believed to be

Chem. 267:9331-9339(1992).

FUNCTION: Involved in pH regulation to eliminate acids generated by active metabolism or to counter adverse environmental conditions. Major proton extruding system driven by the inward sodium ion chemical gradient. Plays an important role in signal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STRAIN-Spring.
